Request for System Management Requirements

At its meeting on June 26, 1998, the System Management sub-group made progress on the definition of the Concept of Operation. Future work will focus on finalizing that document and in beginning the work on the definition of management information.

The definition of management information will include the definition of a minimal Management Information Base (MIB) which supports the requirements for system management information.

The sub-group requests that the WGs assist us in the identification of the system management information that is required for proper operation of the ATN and the ATN applications. The requirements identified will be used to generate specific managed objects for inclusion in the system management MIB.

Specifically, the sub-group requests from WG3:

- specific requirements for both air-ground and ground-ground applications system management information, and
- specific requirements for application configuration data.

From WG 2:

- specific requirements for internet management information, and
- specific requirements for internet configuration data.

From WG 1/ SG 2:

- specific requirements for management information relating to security management.

The System Management sub-group requests the information prior to the Bordeaux ATNP WG meetings to fit the planned system management schedule. The sub-group has established a schedule to have drafts available by the conclusions of the next WG meetings.
